My Motivation to join HackerFab IITB

- Always been fascinated by chip manufacturing, feels like modern day magic.
    - People used to carve runes into stone in an attempt to do magic, we currently do the same thing, just a lot smaller, and we can somehow make rocks think.
- Learned about hackerfab through a friend, Immediately felt like ‘I’m gonna join this at any cost’
- As per my understanding, hackerfab is a team which builds shit. Shit which is difficult and/or expensive to buy, making it inaccessible to most students.
- The long term vision for hackerfab is to make education regarding semiconductor manufacturing easily accessible to all students.
- What I would like to do during my time at hackerfab:
    - If I’m being ambitious, ultimately I’d want to build my own processor, both designed and manufactured in-house.
    - Being a bit more realistic, I’d like to build some simple CMOS ICs, starting with simple logic gates, then a decade counter, then perhaps a DAC/ADC.
- My vision and hopes for the team
    - Helps me learn how to build various things with my own hands
    - Over time, helps me get competent in analogue design, etc.
    - Makes my tenure here fun :)
